

# Virtualization

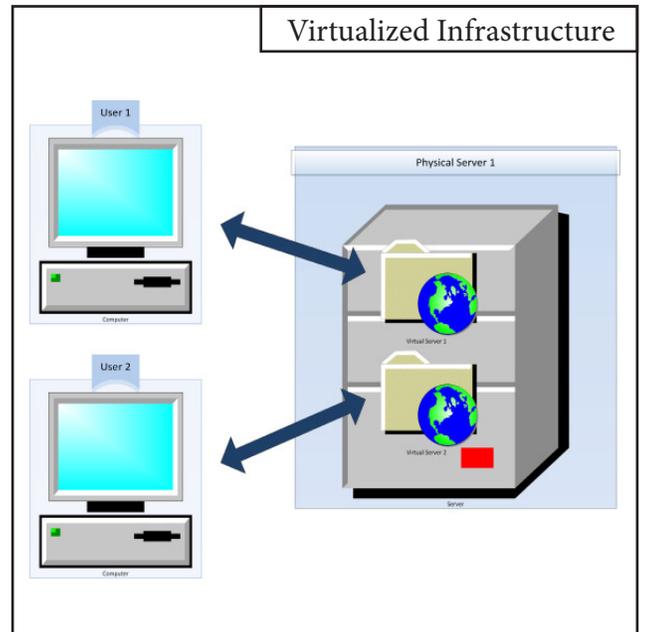

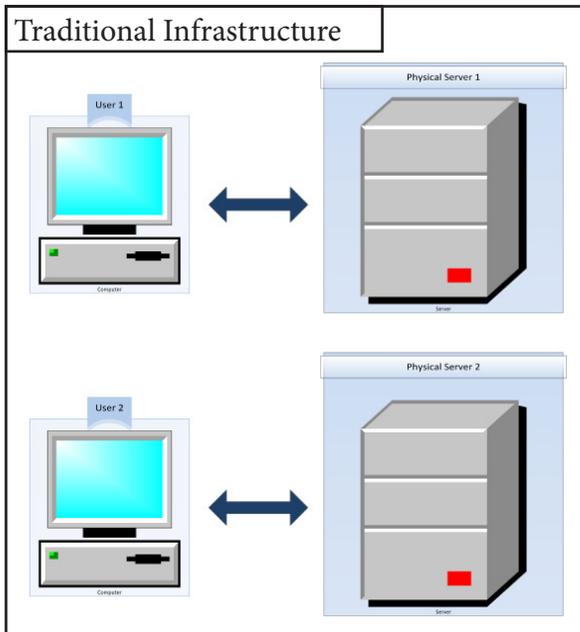

Ask yourself:

- Do I want to simplify the technology infrastructure of my business?
- Do I want the option to easily expand my infrastructure as my business grows?
- Do I want to save considerable overhead costs for my infrastructure?

If you said 'yes' to any of these questions, then it is time to consider Virtualization.

## What is Virtualization?

Simply put, Virtualization is creating a virtual version of something, such as a network server. For example, instead of purchasing two physical servers to handle two different workstations, a single physical server can be 'virtualized' to act as two, allowing the same performance with less cost. (shown below)

## How can this benefit your business?

- Lower overhead costs
- Improved scalability
- Simpler IT management
- Greater disaster recovery options
- Higher security
- Remote accessibility
