

# FileSleuth

data assessment service

Every 2 years, all existing data more than doubles.  
Are you using too much storage?

## Benefits:

- Reduces file storage needs an average of 30% - 40%
- Reduces cost for backup by eliminating duplicate and low-value content from backup strategies
- Provides insight into what content is generated and its cost
- Useful as tool to implement policy for storage usage.
- Optimized solution when paired with Business Continuity Data Service

## The AME Group

- Serving clients since 1985
- 100% Employee-Owned
- Over 25 Offices
- We still do business with our first customer

## What is it?

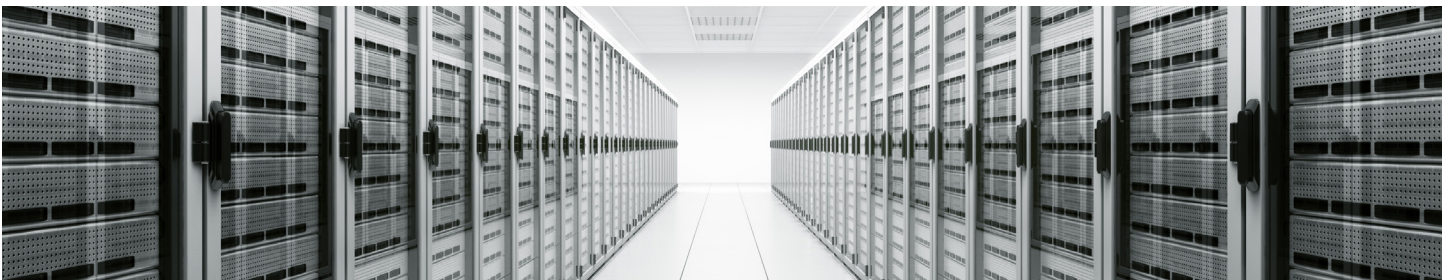

FileSleuth is a data analysis service which pulls data on all the files located on a server. This service will show information such as the size, age, and location of files, as well as any duplicate data.

## How does it work?

The AME Group technician will run the FileSleuth operation on the specified server, allowing it to gather the requested information. When finished, The AME Group will compile a report on the data for easy viewing. The data owner can then decide if they would like the old or duplicated data removed to save storage space.

## Why do I need it?

Storage space can be expensive, particularly when using offsite backup solutions. FileSleuth allows the user to eliminate unnecessary files so that they do not take up valuable space. By reducing files, smaller storage and backup solutions can be utilized. FileSleuth also allows the user to see who is storing what type of files on the company server. This permits storage guidelines to be more easily set.
